User Story #95 — Finalizing the UX/UI for Feedback Screen

As a user,

I want to quickly review and optionally correct the system-generated auto-response and provide lightweight feedback about its accuracy, so that the messaging agent improves future responses and better reflects my intent.

Acceptance Criteria

1. The system shows a preview of the generated auto-response before sending.
2. The user can edit the response within a 7-minute window.
3. The user can view and correct inferred context tags.
4. The user can provide quick binary feedback via thumbs up/down.
5. The system collects daily quality feedback via star rating.
6. The user may optionally leave free-text comments describing issues.

These design elements correspond to the core feedback signals identified in the feedback architecture: binary ratings, edit-based feedback, context override, scaled rating, and free-text feedback.

Screen 1 — Notification & Pre-Send Preview

Purpose

This screen allows the user to review and optionally modify an automatically generated message before it is sent.

It also captures implicit and explicit feedback signals with minimal friction.

This interface is crucial because:

- Edited responses produce high-quality feedback signals about tone and correctness.
feedback_LLM_vs_NonLLM_response...
- Context correction allows the system to fix incorrect sensor inference such as activity or environment.
feedback_LLM_vs_NonLLM_response...

UI Layout Structure

Top Header Section

Title:

Auto-Reply Pending

Subtitle:

Reviewing response to *Sarah Jenkins*

Design Intent

- Reinforces that the system is waiting for user confirmation
- Clearly communicates the recipient context

Editing Window Indicator

Component: Time-Based Edit Indicator

Example:

🕒 Sending in 6:46

UX Behavior

- Countdown timer starts at 7 minutes
- If the timer expires, the message is sent automatically
- If the user presses Send Now, it sends immediately
- If the user presses Cancel Send, the auto-response is aborted

Visual Design

- Rounded pill container
- Soft blue background
- Clock icon

Quick Feedback Buttons

Located beside the timer.

Icons

Thumbs Up

Thumbs Down

Purpose

Provide low-effort binary feedback per response event.

UX Behavior

- Tap instantly records feedback
- Non-intrusive
- Optional

Binary feedback provides high-volume signals for evaluating response quality and prompt configurations.

Context Detection Card

Expandable UI component.

Card Title

Context Detected

Instruction Text

"Adjust tags if the situation was misjudged. This helps improve future suggestions."

Context Tags

Displayed as editable chips.

Example:

Activity: In a meeting

Sender: Manager

Urgency: Normal

Each tag:

- Removable
- Editable
- Replaceable via dropdown

Context Editing Interaction

User can:

- Tap tag → change value
- Remove incorrect tag
- Add new tag

Example corrections:

Activity: Sleeping

Location: Home

Sender: Friend

UX Importance

Incorrect context produces poor auto-responses.

Allowing users to correct these tags enables upstream improvements to the context inference system.

feedback_LLM_vs_NonLLM_response...

Response Editing Section

Editable message container.

Example:

Hi Sarah, I'm currently in a design sync until 3 PM and unable to review the deck right now. I'll take a look as soon as I'm out.

UI Properties

- Multi-line editable field
- Rounded container
- Light grey background

Indicator

Small label:

EDITABLE

Captured Feedback

System logs:

Generated response

User edited response

Context metadata

Timestamp

This creates training triplets for improving LLM outputs.

feedback_LLM_vs_NonLLM_response...

Action Buttons

Bottom section of card.

Left Button:

Cancel Send

Right Button:

Send Now

Button Behavior

Cancel Send

- Cancels auto-response
- Logs negative implicit feedback

Send Now

- Sends edited or original response
- Logs event metadata

Bottom Navigation

Three-tab navigation.

Screen 2 — End-of-Day Questionnaire

Purpose

Capture daily summary feedback about auto-response accuracy.

This enables:

- Prompt evaluation
- System tuning
- Identification of edge cases

UI Structure

Page Header

End of Day Review

Subtitle

How accurately did your auto-responses reflect your intent today?

Rating Component

1–5 star rating system.

UX Behavior

User taps number of stars.

Examples:

1 star - Poor responses

3 stars - Mixed quality

5 stars - Accurate responses

Data Captured

User ID

Date

Star rating

Total responses that day

Context configurations used

Star ratings allow graded quality evaluation beyond simple binary approval.

feedback_LLM_vs_NonLLM_response...

Optional Feedback Field

Text Input

Placeholder:

Did you notice any specific issues or edge cases?

Example User Comments

- "It said I was in a meeting but I was actually sleeping."
- "Tone was too formal for my friends."
- "It mentioned noise levels incorrectly."

UX Principles

- Optional
- No minimum length
- Encourages qualitative insights

Free-text feedback helps surface unexpected system failures not captured by structured signals.

feedback_LLM_vs_NonLLM_response...

Submit Feedback Button

Large centered button.

Submit Feedback

Disabled until:

- Star rating selected

Bottom Navigation

Same as Screen 1.
